(54) **A system for locating automatically video segment boundaries and for extraction of key-frames**

(57) The present invention describes an automatic video content parser for parsing video shots such that they are represented in their native media and retrievable based on their visual contents. This system provides methods for temporal segmentation of video sequences into individual camera shots using a novel twin-comparison method. The method is capable of detecting both

camera shots implemented by sharp break and gradual transitions implemented by special editing techniques, including dissolve, wipe, fade-in and fade-out; and content based key frame selection of individual shots by analysing the temporal variation of video content and select a key frame once the difference of content between the current frame and a preceding selected key frame exceeds a set of preselected thresholds.
